1 About Sophos Connect Admin

In Sophos Connect Admin you can import config [.tgb] files and configure various options for your VPN setup.

Note

For information on how to configure and export a .tgb file on the XG, see the Sophos Connect Client section of the help guide: [Sophos Connect client](#).

The installation and uninstallation processes are the same as the processes for Sophos Connect. See the [Installation](#) section of the Sophos Connect help guide for more information.

2 Editing configuration files

You can edit your configuration [.tgb] files in Sophos Admin, which provides you with more granular VPN configuration options.

Open the .tgb file you have exported from the XG in Sophos Admin. You can:

- Enable **Send Security Heartbeat** to allow Sophos Endpoint to send a heartbeat to the XG.
- Enable **Allow Password Saving** to allow the users to save their user name and password on their machine.
- Enable **Auto-Start Tunnel** to automatically enable the connection after the user logs on to Sophos Connect.
- Enable **Prompt for 2FA** if you have configured Two Factor Authentication for the VPN users on the XG.
- Add, modify and delete **Networks** that the user can connect to. Adding specific networks to the list enables split tunneling, as the user will access resources on those networks through the VPN connection, but will access internet resources straight through their remote gateway.

Note

If you delete all networks, **Tunnel All** mode will be activated, meaning all traffic will be directed through the VPN connection.

- Change the **Connection Name** and **Target Host**.

If you **Clear** the configuration, you will need to import the .tgb file again.

If you **Save** the configuration, it will be saved as a .scx file.

Note

You can import .scx files and re-edit them.

When you have saved the file, you can send it to the user, who will import it into Sophos Connect.
